

COMMITTEE ON TOXICITY OF CHEMICALS IN FOOD, CONSUMER PRODUCTS AND THE ENVIRONMENT

Review of potential risks from polybrominated biphenyls (PBBs) in the diet of infants and 1 to 5 year old children

Background

1. The Scientific Advisory Committee on Nutrition (SACN) is undertaking a review of scientific evidence that will influence the Government's dietary recommendations for infants and young children. SACN is examining the nutritional basis of the advice. The Committee on Toxicity in Food, Consumer Products and the Environment (COT) was asked to review the risks of toxicity from chemicals in the diet of infants, most of which has been completed, and young children. The reviews will identify new evidence that has emerged since the Government's recommendations were formulated, and will appraise that evidence to determine whether the advice should be revised. The recommendations cover diet from birth to age five years, but are being considered in two stages, focussing first on infants aged 0 to 12 months, and now on advice for young children aged 1 to 5 years.
2. There are currently no Government dietary recommendations for infants and young children which relate to polybrominated biphenyls (PBBs).
3. The 2015 COT statement on potential risks from PBBs in the infant diet is included in Annex A¹. At that time, the COT concluded that reliable estimation of infants' exposure to PBBs was not possible, and no meaningful risk assessment could be performed. However, in discussing the scope of work for 1-5 year old children (TOX/2015/22) at the October 2015 meeting, the COT decided that exposure assessments should be performed, and that a literature review should be undertaken to capture any new UK data for PBBs.
4. This discussion paper provides potential PBB exposures for infants and children in the UK aged 1 to 5 years.
5. The risks associated with exposures to PBBs are assessed in this discussion paper using the approaches recommended by COT when discussing infant exposures, albeit not used during the assessment due to the lack of data. COT recommended that planar and non-planar PBBs be assessed separately. Toxic equivalency factors (TEFs) assigned to dioxin-like

¹ <http://cot.food.gov.uk/sites/default/files/pbbstatementfinal.pdf>

polychlorinated biphenyls (PCBs) could be applied to the corresponding PBB congeners to determine toxic equivalences (TEQs) and combined with the TEQs for other relevant compounds to give a measure of total intake of chemicals with dioxin-like properties, for comparison with the tolerable daily intake (TDI) of 2 pg WHO-TEQ²/kg bw. For the non-planar compounds, data from the National Toxicology Programme (NTP) carcinogenicity study (NTP, 1993) could be used to establish a reference point for the purposes of risk characterisation.

6. There are no new reviews on PBBs from international bodies to consider updating or revising the toxicology section from the infant statement.

PBB exposures in infants and young children aged 4 months to 5 years

Sources of PBB exposure

Dietary

Breast milk

7. A literature search did not identify any new UK data for PBB levels in breast milk since those in the 2015 COT statement.

Food

8. No new data have been identified since the COT statement on PBBs in the infant diet. Table 3 of Annex A shows data on the planar PBBs -77, -126 and -169 in white and oily fish. Annex B contains data on the concentrations of selected planar- and non-planar-PBBs in composite samples of the 19 food groups of the 2012 Total Diet Study (TDS). The PBBs measured were the non-planar congeners PBB-15, -49, -52, -80, -101, -153 and -209, and three congeners that can adopt the planar structure, PBB-77, -126, -169. This is broadly in line with the emphasis of EFSA (2010), subject to the availability of reference standards in the testing laboratory. EFSA had concluded that PBB-153 was the most important congener to be measured, based on the analytical feasibility to measure it routinely in accredited laboratories, the production volume, the occurrence in food and feed, its persistence in the environment and its toxicity.

Environmental

9. A literature search identified no new relevant data for levels of PBBs in soil, water, air and dust since those in the 2015 COT statement on the potential risks of PBBs in the infant diet. Levels of PBBs measured in

² WHO Toxicity Equivalences (WHO-TEQ), derived from application of relevant Toxicity Equivalence Factors (TEFs) as described in Van den Berg *et al.*, 2006.

domestic dust samples from Pretoria, South Africa, were previously described (paragraph 23 of Annex A).

Exposure

10. Body weight data are as used previously by COT for infants and from the UK Dietary and Nutrition Survey of Infants and Young Children (DNSIYC) (DH, 2013) and the National Diet and Nutrition Survey (NDNS) (Bates *et al.*, 2014), as summarised in Table 1.

Table 1: Body weights used in exposure assessments.

Age bands (months)	Weighted bodyweight
0 - <4	5.9 kg
≥4 - <6	7.8 kg
≥6 - <9	8.7 kg
≥9 - <12	9.6 kg
≥12 - <15	10.6 kg
≥15 - <18	11.2 kg
≥18 - <24	12.0 kg
≥24 - <60	16.1 kg

Dietary

11. Consumption data from the Diet and Nutrition Survey in Infants and Young Children (DNSIYC) (DH, 2013) are used for the 4 to 18 month age group and data from the National Diet and Nutrition Survey Rolling Programme years 1-4 (NDNS) (Bates *et al.*, 2014) for the 18 months to 5 years age group have been used for the estimation of dietary exposure.

Breast milk

12. The estimated exposures of exclusively breastfed infants, aged 0 to 6 months are shown in Table 2. Data on breast milk consumption from DNSIYC have been used in estimating exposure from breastmilk in the 4 – 18 months age groups (not exclusively breastfed), based on the median sum of PBB-15, -49, -52, -80, -101, -153, and -209 of 0.08-0.22 ng/g fat (LB-UB median, equivalent to 2.09 – 5.74 ng/L) and a maximum of 0.86 ng/g fat (equivalent to 21.59 ng/L). However only PBB-153 was quantified in all samples, and PBB-101 in a single sample. There were too few records of breast milk consumption for children older than 18 months in NDNS (Bates *et al.*, 2014) to allow a reliable exposure assessment, and breast milk is expected to contribute minimally in this age group.

Table 2: PBB exposure (pg/kg bw/day) from exclusive breastfeeding by infants estimated for average and high level consumption.

Congener	ng PBB/L of breast milk	Exposure (pg/kg bw/day)			
		Average consumer 800 mL/day		High consumer 1200 mL/day	
		0 - 4 months	>4 - 6 months	0 - 4 months	>4 - 6 months
PBB-153 (median)	2.09	283	214	425	321
PBB-153 (max)	19.83	2689	2034	4033	3050
Σ PBB ^a (Median LB – UB)	2.09 – 5.74	283 - 778	214 - 589	425 - 1167	321 - 883
Σ PBB (max)	21.59	2927	2214	4391	3321

^a Σ PBB is the sum of PBB-15, -49, -52, -80, -101, -153, and -209.

LB-UB = lower bound to upper bound

13. Table 3 shows the estimated exposure from breastmilk in infants and young children aged ≥ 4 to < 18 months. Levels of PBB-153 are given separately as it was the predominant congener and was measured in all samples.

Table 3: Estimated PBB exposure (pg/kg bw/day) from breast feeding in infants and young children aged between ≥ 4 to < 18 months.

	Age (months)				
	$\geq 4 - < 6$	$\geq 6 - < 9$	$\geq 9 - < 12$	$\geq 12 - < 15$	$\geq 15 - < 18$
Mean (pg/kg bw/day)					
PBB-153 median	190	140	80	60	50
PBB-153 max	1820	1320	750	580	500
Σ PBB (median LB-UB)	190 - 530	140 - 380	80 - 220	60 - 170	50 - 150
Σ PBB max	1990	1440	820	630	550
P97.5 (pg/kg bw/day)					
PBB-153 median	320	330	240	160	110
PBB-153 max	3070	3160	2300	1490	1030
Σ PBB (median LB-UB)	320 - 890	330 - 910	240 - 666	160 - 430	110 - 300
Σ PBB max	3340	3440	2500	1620	1120

Food

14. Possible exposures were calculated from TDS data separately for the planar and non-planar PBB congeners. There was a very high proportion of analytical data below the limit of detection and all results are presented as upper bound (i.e. the limit of detection is used).

15. Table 4 shows the estimated exposure to the sum of the planar PBBs, -77, -126, and -169 expressed as WHO-TEQ. Data for the individual congeners and food groups are in Annex C. Total mean and 97.5th percentile exposures range from 0.051 to 0.074 and 0.093 to 0.21 pg WHO-TEQ/kg bw/day respectively.

Table 4: Estimated upper bound exposures to the sum of PBB -77, -126 and -169) (pg WHO-TEQ/kg bw/day).

Food Group	Age (months)						
	≥4 - <6	≥6 - <9	≥9 - <12	≥ 12 - < 15	≥15 - <18	≥18 - <24	≥24 - <60
Mean	0.056	0.051	0.053	0.064	0.068	0.074	0.060
P97.5	0.21	0.21	0.13	0.13	0.12	0.12	0.093

Table 5 shows upper bound dietary exposures to the sum of seven non-planar PBBs (PBB-15, -49, -52, -80, -101, -153, and -209) Data for the individual congeners and food groups are in Annex D. Total mean and 97.5th percentile exposures to the sum of the non-planar PBBs ranged from 456 to 843 and 1109 to 1620 pg/kg bw/day, respectively. The fish group was the main contributor to total mean exposure to PBB-49, PBB-52 and PBB-101 in all age groups. Dairy products made the main contribution to total mean exposures to PBB-153 for all age groups; fish, carcass meats and poultry groups made smaller contribution to total mean exposures for this congener in all age groups..

Table 5: Estimated exposure to the sum of PBB-15, -49, -52, -80, -101, -153, and -209 (pg/kg bw/day)

Food Group	Age (months)						
	≥4 - <6	≥6 - <9	≥9 - <12	≥ 12 - < 15	≥15 - <18	≥18 - <24	≥24 - <60
Mean	458	456	513	752	788	843	673
P97.5	1620	1616	1230	1322	1318	1544	1109

Environmental

Dust

16. Potential exposures of UK infants aged >9 to 12 months and young children aged 1 to 5 years to PBBs in dust were calculated assuming ingestion of 100 mg/day (US EPA, 2008; WHO, 2007) and median and 95th percentile concentrations of 1.3 and 15.3 ng/g dust for the sum of PBB-4, -10 and -209 (Kefeni *et al.*, 2014) (Table 6). Children of these age groups are likely to consume more soil and dust than younger infants who are less able to move around and come into contact with soil and dust. However it is unclear if such levels reported in South African homes are representative of UK homes, and consequently exposures to PBBs.

Table 6: Potential upper bound exposure of infants aged ≥9 months to <5 years to the sum of PBB-4, -10, and -209 via ingestion of dust estimated from samples of dust in South African homes.

Age group	Estimated PPB exposure from ingestion of dust pg/kg bw/day	
	Median ^a	P95 ^b
≥9 - <12 months	14	159
≥12 - <15 months	12	144
≥15 - <18 months	12	137
≥18 - <24 months	11	128
≥2 - <5 years	8	95

Based on data from Kefeni *et al.*, (2014).

^aMedian derived estimates are based on LOD.

^b95% percentile derived estimates are based on measured levels with the exception of PBB-10 which was taken as the LOD.

Risk characterisation

17. Potential risks from exposure of infants and young children to planar PBBs were characterised by comparison to the TDI of 2 pg WHO-TEQ/kg bw. Based on upper bound 97.5th percentile estimates the maximum contribution to the TDI is 10.5% (Table 7). This is a conservative estimate due to the upper bound approach to the high number of levels that were below the limit of detection. Therefore it is likely the contribution of planar PBBs to the diets of infants and young children do not have an impact on whether the TDI for dioxin-like compounds is exceeded.

Table 7: Percent contribution of upper bound exposure to the sum of the planar PBBs (PBB-77, -126 and -169), to the TDI of 2 pg WHO-TEQ/kg bw.

	Age (months)						
	$\geq 4 - <6$	$\geq 6 - <9$	$\geq 9 - <12$	$\geq 12 - <15$	$\geq 15 - <18$	$\geq 18 - <24$	$\geq 24 - <60$
Mean	3	2.5	2.5	3	3.5	3.5	3
P97.5	10.5	10.5	6.5	6.5	6	6	4.5

18. Margins of Exposure (MOEs) for the non-planar PBBs have been calculated by dividing the NOAEL of 0.15 mg/kg bw/day from the NTP carcinogenicity study by the estimated exposures. MOEs based on exclusive high-level consumption of breast milk range between 45,200 and 50,300, and for breast milk based on consumption data and upper bound estimates range between 43,600 and 134,000 (Tables 8 and 9). MOEs based on high level consumers using upper bound exposure estimates from food or breast milk range between 92,000 to 135,000 (Table 10).

Table 8: MOEs for non-planar PBBs calculated from upper bound mean and 97.5th percentile exposure via the diet (Table 4).

	Age (months)						
	$\geq 4 - <6$	$\geq 6 - <9$	$\geq 9 - <12$	$\geq 12 - <15$	$\geq 15 - <18$	$\geq 18 - <24$	$\geq 24 - <60$
Mean	328000	329000	292000	199000	190000	178000	223000
P97.5	92600	92800	122000	113000	114000	97200	135000

Table 9: MOEs calculated from average and high level exclusive breast milk consumption estimates using the sum of the maximum PBB levels reported in breast milk,

	Average consumer 800 mL/day		High consumer 1200 mL/day	
	0 - 4 months	>4 – 6 months	0 - 4 months	>4 – 6 months
Σ PBB (max)	67900	75800	45200	50300

Table 10: MOEs calculated from 97.5th percentile exposure estimates based on the sum of the maximum PBB levels reported in breast milk.

	Age (months)				
	≥4 - <6	≥6 - <9	≥9 - <12	≥ 12 - < 15	≥15 - <18
ΣPBB max	44900	43600	60000	93000	134000

19. The MOEs measured in dust were non-planar and thus MOEs have been calculated. MOEs for dust exposure range between 943,000 and 18,800,000 (Table 11).

Table 11: MOEs calculated from median and 95th percentile estimates of exposure from dust.

	Age (months)				
	≥9 - <12	≥12 - <15	≥15 - <18	≥18 - <24	≥24 - <60
Median	10,700,000	12,500,000	12,500,000	13,600,000	18,800,000
P95	943,000	1,040,000	1,090,000	1,170,000	1,580,000

20. There is a high degree of uncertainty in this risk assessment. The use of the upper bound approach to the large number of data below the limit of detection will overestimate exposures to the measured congeners. Only a limited number of congeners have been measured, based on expected occurrence and toxicity, and therefore they probably do not seriously underestimate total exposure. The use of the upper bound approach to the large number of data below the limit of detection will overestimate exposures to the measured congeners. The profile of congeners present in food and the environment is not representative of the technical mixture used in the carcinogenicity study from which the reference point for the MOE approach is derived. Furthermore, the mechanism of carcinogenicity of this technical mixture has questionable relevance to humans.

21. Taking these uncertainties into account, the large margins of exposure in this risk assessment do not indicate a cause for concern.

Questions on which the views of the Committee are sought

22. Members are invited to consider the following questions and to raise any other matters that arise from the newly submitted data.

i). Do Members consider the available information sufficient to perform a risk assessment for PBBs?

- ii). Would Members wish to include additional exposure estimates, for example using data on the planar PBBs -77, -126 and -169 in white and oily fish highlighted in Table 3 of Annex A?
- iii). Do Members consider that the levels in dust should be included?
- iv. Do Members agree with the draft conclusion in paragraph 21?
- v). Are Members able to provide other advice on the approach to be taken?

TOX/2015/34 ANNEX C

**COMMITTEE ON TOXICITY OF CHEMICALS IN FOOD,
CONSUMER PRODUCTS AND THE ENVIRONMENT**

**Review of potential risks from polybrominated biphenyls (PBBs) in the
diet of infants and 1 to 5 year old children**

**Estimated exposures to PBBs -77, -126 and -169, and the sum of these
congeners, based on TDS data, and for infants and children aged ≥4
months - <5 years**

**Secretariat
November 2015**

This is a background paper for discussion.
It does not reflect the views of the Committee and should not be cited.

Table C1: Upper bound PBB exposures in pg WHO-TEQ/kg bw/day for age ≥4 - <6 months.

TOX/2015/34 ANNEX D

COMMITTEE ON TOXICITY OF CHEMICALS IN FOOD, CONSUMER PRODUCTS AND THE ENVIRONMENT

Review of potential risks from polybrominated biphenyls (PBBs) in the diet of infants and 1 to 5 year old children

Estimated exposures to non-planar PBBs based on TDS data, for infant and children aged ≥4 months - <5 years

**Secretariat
November 2015**

This is a background paper for discussion.
It does not reflect the views of the Committee and should not be cited.

Mean and 97.5th percentile, upper bound, estimated exposure (pg/kg bw/day) data for non-planar PBB congeners for each of the 19 food groups in the TDS. Original lipid weight values quoted in the 2012 TDS were converted to a whole food basis using the repeat mean fat content for each individual food group.

This is a background paper for discussion.
It does not reflect the views of the Committee and should not be cited.
